

Parallel Substitution Algorithm: Theory and Application

This book treats a cellular automaton as a model of algorithmic-oriented architectures for array data processing. Such an approach motivates the extension of the classical concept of Cellular Automaton to Parallel Substitution Algorithm (PSA) in order to fit the potentialities of microelectronics and optics. In this way the following problems of designing cellular architectures are solved: mapping a PSA into a cellular array, space-time, space-space (2D to 3D) and local-global equivalent transformations of PSAs, composition and decomposition of PSAs, as well as the validity of cellular computations in synchronous and asynchronous modes.

This book sums up the results of research in the field of fine-grained parallelism and architectural design of cellular algorithm-oriented processing units. Parallel Substitution Algorithm (PSA) is a new model for distributed (cellular) computations. It provides a concise mapping of distributed computation processes Theory and Application. Parallel Substitution Algorithm (PSA) is a new model for distributed (cellular) computations. It provides a concise mapping of distributed computation processes into cellular arrays. A PSA is specified by a set of parallel substitutions operating over a cellular array.
